INVESTOYARD

PLATFORM OVERVIEW FOR DISTRIBUTION PARTNERS

The IPO platform, end to end.

Mainboard and SME, from the day the RHP lands to listing day — research, applications, allotment and reporting on one stack. Take it as it stands, put your own brand on it, or keep your front end and integrate over the API.

Safal Capital Services Private Limited

v2.0 · October 2026 · newipo.finwave.co

THE PLATFORM

Five layers. You choose where to plug in.

Most partners take the whole stack under their own brand. Some keep the front end they already have and use one endpoint. Both are first-class, and you can move between them without rebuilding.

01 RESEARCH

The investor experience

Everything a client reads before they decide — live demand, documents, history.

02 APPLICATIONS

Applying and printing

UPI and bank ASBA, families in one pass, fillable forms for clients who sign on paper.

03 INTEGRATION

The partner channel

An API, a white-label and a self-service console — pick your depth.

04 OPERATIONS

The operator console

What your desk uses: catalogue, masters, allotment imports, reporting, messaging.

05 DATA

The engine underneath

The exchange poller, the issue engine and the rule pack that keep every figure honest.

01 RESEARCH

The investor experience

Everything a client reads before they decide — live demand, documents, history.

The number your client refreshes

Subscription is the figure an investor checks ten times on closing day, and the one most easily got wrong. We reconcile both exchanges into a single table, deduct the anchor from QIB so the multiple measures what is actually available, and show applications beside shares — because allotment odds depend on how many people applied, not how many shares they asked for.

Every row cross-checks: Book Size × Times = Subscribed, recomputed locally from raw exchange demand rather than taken on trust.

HD Fire Protect Limited — LIVE

Mainboard · ₹258–271 · lot 55 · day 1

CATEGORY	SUBSCRIBED	APPLICATIONS
QIB (Ex. Anchor)	0.42×	52
HNI (10 L+)	10.81×	7,415
HNI (2–10 L)	12.65×	20,748
Retail	3.82×	5,48,068
Employee	2.95×	2,083
Total	**3.26×**	**5,78,366**

Both exchanges, reconciled · as at 13 October 2026

Live subscription, both exchanges

NSE catwise and BSE demand schedule reconciled into one table — QIB, both HNI bands, Retail and every reserved quota. Share-wise and application-wise, because allotment odds depend on the second.

Day-wise and hourly history

How demand built, bidding day by bidding day, with an hourly drill-down across the last three days.

Lot ladder and reservation

Minimum bid per category, lot ranges, amounts and applications required for 1x — derived from the issue's own reservation table, not a rule of thumb.

Expected premium

Grey-market premium where it exists, always carrying the disclaimer that it is unofficial and unregulated, plus a published scoreboard of how it scored against actual listings.

Allotment on any PAN

Registrar allottee files matched to applications automatically with the registrar's own rejection reason. The public checker answers any PAN, including ones we hold no application for.

Listing performance

What issues actually did on listing, as a record rather than a projection.

Calendar and reminders

Open, closing, allotment and listing dates with lifecycle alerts, so a client hears before a window shuts rather than after.

Documents, financials and notes

RHP and DRHP on the issue itself, four-year financials, objects of the issue, promoters, anchor book, written market notes and a plain-English glossary.

Built to be found

Open, upcoming, listed and SME listing pages, a full archive by year and month, and issue pages that rank — so a client searching a name lands on your platform.

Web and mobile

A responsive site that installs as an app, and a native mobile app with a five-tab layout built for one task per stage.

02

APPLICATIONS

Applying and printing

UPI and bank ASBA, families in one pass, fillable forms for clients who sign on paper.

UPI and bank ASBA

The full apply flow with Retail, HNI and reserved-quota tabs, cut-off bidding and a single itemised consent.

Families in one pass

Apply for a client and their family together with per-member overrides, rather than repeating the flow per person.

Multiple demat accounts

One PAN may hold several demat accounts; the investor picks which one an allotment credits to, at the moment of applying.

Print forms

Fillable ASBA forms filled by field name from the real SEBI template, in your own PDF series, for clients who still sign on paper.

Correcting a live bid

A mistyped UPI ID can be corrected after submission, restated to the exchange across every live bid that applicant holds.

Chasing a stuck block

Where funds stay blocked past the allotment grace period, the investor can raise an unblock request to the issue's sponsor banks, with the cooldown and eligibility decided server-side.

Status from the exchange

The exchange's own UPI wording shown verbatim beside our status, so a rejection says which kind of rejection it was.

The self-PAN rule, enforced

One public application per PAN per issue, plus one per reserved quota — checked on a keyed fingerprint rather than a name match.

03

INTEGRATION

The partner channel

An API, a white-label and a self-service console — pick your depth.

One endpoint, your own front end

Post final application data to the Partner Print-PDF API and keep your existing flow. Per-partner API keys, issued and revoked from the console.

Forms that arrive filled on WhatsApp

WhatsApp's in-app viewer ignores the PDF flag telling a reader to regenerate field appearances, so a form that looks right in Adobe can reach a client blank. Every form we produce is flattened — what you forward is what they see.

What you send is what prints

Each print stores the exact payload received and the PDF is filled from that snapshot, not from a shared client record. A later correction for the same PAN produces a correct form without rewriting what earlier prints were based on.

Documentation you can run

A full API reference with an inline tester: pick an issue, edit the payload, run it against the real print engine and download the PDF a partner would receive. Nothing persisted, no form numbers consumed.

Reporting that answers questions

Every call logged and every print reportable, with CSV export and summaries by partner, by day, by month and by IPO — including which issues are failing and why.

White-label

Your brand, your domain, your team logins, your own settings cascade. Clients never see ours.

Branches, properly scoped

Branches sit under their parent with scope enforced in the database rather than assumed in code, so a branch login sees its own book and no one else's.

Self-onboarding

Apply online, get reviewed, set a password from a one-time link. Applications live in their own queue, never as half-real tenants.

04 OPERATIONS

The operator console

What your desk uses: catalogue, masters, allotment imports, reporting, messaging.

Catalogue and completeness

Every issue scored against 22 checks across six groups, so an incomplete page is visible before a client finds it rather than after.

Enter an issue four ways

By hand, from the operator's Excel workbook, from an exchange PREANCHOR file, or by reading a one-page IPO summary card image straight into the form.

Anchor intimation, parsed

The anchor letter read into a reviewable roster — text extraction first, vision for the scanned copies NSE files as images, with unmatched investors addable to the master in one click.

Allotment at scale

Registrar files to 120 MB in DBF, XLSB, XLSX or CSV, parsed off the request thread, matched to applications by PAN, searchable by partial PAN and amount, exportable as CSV, then archived and restorable.

Masters

Lead managers, registrars, sponsor banks, anchor investors, UPI handles, sectors, industries, categories and issue types — each with inline add from the issue form.

Content and messaging

A rich-text news engine, message templates with a per-template test send, and a delivery log across SMS, email and WhatsApp recording what was sent and what the provider replied.

Alerts that come to you

A readiness check on the dashboard naming any open issue the poller cannot compute, with trading days already lost and trading days left — because a warning nobody opens is not a warning.

Roles and audit

Granular permissions per menu, and an audit trail attributing every change to a person and a time.

05

DATA

The engine underneath

The exchange poller, the issue engine and the rule pack that keep every figure honest.

The subscription poller

Both exchanges polled through the bidding window, every 60 seconds and every 5 seconds for the final 90 minutes, continuing through the grace hour while exchanges consolidate.

The issue engine

Reservation, carve-outs, anchor allocation and category splits computed from one tested engine shared by every surface, so the website, the console and the mobile app cannot disagree.

The rule pack

ICDR category bounds, the NII split ratio, the anchor cap, minimum application value and the reserved-quota caps, held in one audited module and imported everywhere.

A real trading calendar

Working-day arithmetic from the exchange's own published holiday list, so T+3 is counted correctly across a weekend and two festivals rather than guessed from weekdays.

Provenance on every figure

Each reservation count is marked as the exchange's, the operator's off the RHP, or derived by us — and a derived table says so on the page.

No synthesised data, anywhere

Every fabricated fallback was removed from this platform deliberately: no invented financials, no placeholder catalogue, no mock demand. Where we hold nothing, the page says so.

WHY INVESTOYARD

IPO data is easy to display and hard to get right.

Most of the engineering here has gone into the second part, because a figure a client can disprove against another site costs you the relationship, not us.

Reconciled, not scraped

Every subscription row satisfies Book Size × Times = Subscribed, recomputed locally from raw exchange demand rather than trusted from a feed. When a figure disagrees with another site, we can say which basis each one is on.

QIB stated net of the anchor

The anchor portion is a sub-allocation of QIB, so measuring public demand against the gross quota overstates the book. We deduct it, label the row, and say whether the figure is an actual allotment or our own estimate.

Validated as it is typed

Category floors and ceilings, the NII ratio, the anchor cap and the date rules are checked at entry, with blocking faults separated from warnings — so a legal but unusual split is flagged, not refused.

SME is a first-class case

A different minimum bid, a two-lot individual application, its own demand thresholds, market-maker reservation and single-exchange issues — modelled properly, not bolted onto Mainboard assumptions.

Honest empty states

A blank is information; a plausible wrong number is not. Where we do not hold a figure, we show nothing and say why.

Fastest where it counts

Five-second polling through the closing window, when the number your client is refreshing changes every tick.

COMPLIANCE, SECURITY AND PRIVACY

Built into the product, not kept beside it.

The rules below are enforced in code, on every application and every issue.

- **We distribute and inform, we do not advise**
  No recommendations, no ratings, no review scores and no target prices anywhere on the platform.
- **SEBI thresholds in one place**
  Retail, HNI and QIB limits, the UPI mandate cap and the ASBA form-type split live in a single audited module imported everywhere.
- **PII tokenised at rest**
  PAN and bank details held in an envelope-encrypted vault, tokenised per tenant.
- **Masked by default**
  Reports show a masked PAN and the last four digits of an account — a support tool, not a contact list.
- **The self-PAN rule**
  Every application uses that applicant's own PAN, demat and bank or UPI, enforced on a keyed fingerprint.
- **Bidding windows respected**
  The regulatory cutoff is a fixed anchor, with T+3 listing from the exchange's published calendar.
- **Tenant isolation in the database**
  Row-level security scopes partner data in the database itself, not only in application code.
- **DPDP consent, itemised**
  Collected just in time with specific purposes listed, recorded against the applicant, never bundled into a blanket agreement.

GETTING STARTED

Four steps, and nothing to build.

1. **Apply**
   A short form — your business, contact and any registrations you hold. Two minutes.
2. **We review**
   Our team checks the details and comes back to you, usually within a couple of working days.
3. **Set your password**
   On approval you get a one-time link to choose a password and sign in.
4. **Integrate or go live**
   Use the platform as it stands, take a white-label, or collect an API key and test against the real print engine from the documentation page.

Applying costs nothing and commits you to nothing.

We will tell you honestly whether the fit works.

INVESTOYARD

Investoyard is operated by Safal Capital Services Private Limited. We distribute public issues and share information about them; we do not give investment advice or recommend any issue. Grey-market premium figures, where shown, are unofficial and unregulated and must not be read as a price or a forecast. Investing in securities carries risk, including loss of capital. Subscription figures shown in this document are a dated snapshot for illustration. Partner terms, including any commercial arrangement, are agreed in writing after approval.
