investoyard

FOR SEBI-REGISTERED STOCK BROKERS

Your IPO desk, under your brand.

Mainboard and SME IPOs, end to end, running under your own brand — or inside the app you already have. Your clients stay yours, the engineering is already done, and every sensitive data feed is gated rather than assumed.

Safal Capital Services Private Limited

v2.0 · October 2026 · newipo.finwave.co

01 Why brokers partner with us

You already have the clients and the licence. What you probably do not have is an IPO desk that keeps them in your app for the one week a year they are most tempted to look elsewhere.

Your clients stop leaving during IPO season

An IPO week is when retail investors shop around — they go elsewhere to check subscription, allotment odds and premium, and some of them do not come back. Carrying the full research surface inside your own app removes the reason to leave.

Live without an engineering project

No exchange integration to build, no RHP structures to model, no registrar file formats to parse, no allotment reconciliation to write. The stack exists and is in production; you put your brand on it.

Your brand, your domain, your clients

Your logo, your colours, your team logins, your own branch tree on your own domain. Clients never see Investoyard anywhere in the journey.

Figures your client cannot fault you on

Every subscription row is recomputed locally from raw exchange demand and cross-checks against itself. A number a client disproves against another site costs you the relationship, not us — so the engineering went there first.

SME handled properly, not bolted on

A different minimum bid, a two-lot individual application, market-maker reservation, single-exchange issues and its own demand thresholds. SME is where most platforms quietly get it wrong.

Compliance posture you can show a regulator

No advice or recommendations anywhere, the self-PAN rule enforced on a keyed fingerprint, itemised DPDP consent, PAN and bank details tokenised in a vault, and your data scoped in the database itself.

02 Three ways to work with us

01 WHITE-LABEL

Your brand, end to end

Your domain, logo and colours, your team logins, your own settings cascade and branch tree. You decide which data surfaces are switched on. Clients never see us.

02 API

Keep the front end you have

Your app stays yours. Call our endpoints for the IPO catalogue and to generate filled ASBA forms, with per-key scopes controlling exactly which data your integration may read.

03 HYBRID

Start on ours, move to yours

Run on the hosted platform while you build, then move to a white-label or the API without re-onboarding a single client or re-papering anything.

03 What your clients get

The research surface is the retention argument. A client who leaves your app to check subscription is a client in someone else's funnel.

Live subscription, both exchanges

NSE catwise and BSE demand schedule reconciled into one table — QIB, both HNI bands, Retail and every reserved quota. Share-wise and application-wise, because allotment odds depend on the second.

Day-wise and hourly history

How demand built across the bidding window, with an hourly drill-down over the last three days.

Lot ladder and reservation

Minimum bid per category, lot ranges, amounts and applications needed for 1x, from the issue's own reservation table.

Allotment on any PAN

Registrar files matched to applications automatically, with the registrar's own rejection reason.

Listing performance

What issues actually did on listing, as a record rather than a projection.

Documents and financials

RHP and DRHP on the issue, four-year financials, objects of the issue, promoters and the anchor book.

Calendar and reminders

Lifecycle alerts so a client hears before a window shuts rather than after.

Web and mobile

A responsive site that installs as an app, plus a native mobile app — both carrying your brand.

04 What you can display

Every data surface is controlled per account. Some are on from day one, some are granted deliberately, and one is locked off on every white-label and cannot be self-enabled.

IPO catalogue and issue structure

ON BY DEFAULT

Name, symbol, board, price band, lot size, issue size, Fresh and OFS legs, reservation split, anchor dates and the full key-date timeline.

From the offer documents and the exchange master.

Offer documents and financials

ON BY DEFAULT

RHP and DRHP on the issue itself, four-year financials, objects of the issue and promoters.

Public filings.

Lot ladder and minimum application

ON BY DEFAULT

Minimum bid per category, lot ranges, amounts and the applications required to reach 1x, derived from the issue's own reservation table.

Derived from the offer document, not a third-party feed.

Listing performance and calendar

ON BY DEFAULT

What issues did on listing as a historical record, plus open, closing, allotment and listing dates with client reminders.

Public exchange data, stated as history rather than projection.

Educational content

ON BY DEFAULT

Plain-English glossary, how allotment works, Mainboard versus SME, and our written market notes.

Our own content. No recommendations, ratings or target prices anywhere.

Your own clients' applications and allotment

ON BY DEFAULT

Every application you submitted, its exchange status, and the allotment result matched from the registrar file with the registrar's own rejection reason.

Scoped to your tenant by row-level security.

Live subscription figures

OPT-IN PER ACCOUNT

Category-wise demand across both exchanges, share-wise and application-wise, with QIB stated net of anchor.

Enabled per account. The API scope is NOT in the default set.

Grey-market premium (GMP)

OFF AND LOCKED

Unofficial, unregulated indicative premium, and the single most sensitive figure on the platform.

OFF and LOCKED on every white-label account — it cannot be self-enabled. On the API it needs an explicit scope, passes a second tenant-level check, and the disclaimer is returned WITH the number so a bare figure can never be handed over.

Registrar allottee rows for non-clients

NEVER SHARED

A registrar file carries PAN-level data for every applicant in the issue, not only yours.

Never exposed to a partner. Your reporting reaches your own book only.

Any other partner's data

NEVER SHARED

Another broker's clients, applications, prints or reports.

Enforced by row-level security in the database, not by application code alone.

Where our responsibility ends and yours begins

The controls above are ours, and we will configure and lock them to whatever you decide. Whether your registration permits publishing a particular figure is your compliance function's determination, not ours — this document is not legal advice. Four things worth settling before you go live:

1. Decide which data surfaces are switched on for your site, and have us lock that configuration.
2. Confirm with your compliance function whether your registration permits publishing each figure.
3. Confirm redistribution rights for exchange-sourced subscription data under your member agreement, or take it under ours.
4. Agree the disclaimer wording that must accompany any indicative figure you display.

05 How your clients apply

UPI and bank ASBA

Retail, HNI and reserved-quota tabs, cut-off bidding and a single itemised consent.

Families in one pass

A client and their family together, with per-member overrides.

Multiple demat accounts

One PAN may hold several; the investor picks which one an allotment credits to.

Print forms in your series

Fillable ASBA forms from the real SEBI template, numbered from your own series, flattened so they arrive filled on WhatsApp rather than blank.

Correcting a live bid

A mistyped UPI ID corrected after submission and restated across every live bid that applicant holds.

Chasing a stuck block

Where funds stay blocked past the allotment grace period, an unblock request to the issue's sponsor banks, with eligibility decided server-side.

The self-PAN rule, enforced

One public application per PAN per issue plus one per reserved quota, checked on a keyed fingerprint rather than a name match.

Exchange status, verbatim

The exchange's own UPI wording beside our status, so a rejection says which kind it was.

06 Data governance and compliance

Isolation in the database

Row-level security scopes your data in PostgreSQL itself, not only in application code, so a query cannot reach another partner's book.

PII tokenised at rest

PAN and bank details held in an envelope-encrypted vault, tokenised per partner.

Masked by default

Reports show a masked PAN and the last four digits of an account — a support tool, not a contact list.

Branches, properly scoped

Your branch tree sits under your tenant with scope enforced at the database, so a branch sees its own book and no one else's.

Scoped API keys

Each key carries explicit scopes. Subscription and GMP are not in the default set and must be granted deliberately.

Roles and audit

Granular permissions per menu and an audit trail attributing every change to a person and a time.

07 Your desk and your back office

Reporting on your own book

Every call logged and every print reportable, with CSV export and summaries by day, by month and by IPO.

Allotment at scale

Registrar files to 120 MB in DBF, XLSB, XLSX or CSV, matched to your applications by PAN, searchable by partial PAN and amount, exportable and archivable.

Documentation you can run

A full API reference with an inline tester — pick an issue, edit the payload, run it against the real print engine and download the PDF your integration would receive.

Operational alerts

A readiness check naming any open issue whose data cannot be computed, with trading days already lost and days left.

Your own settings cascade

Branding, caps and feature flags set at your tenant and inherited by your branches.

Content and messaging

A rich-text news engine, message templates and a delivery log across SMS, email and WhatsApp.

08 What onboarding needs from you

Nothing here is unusual for a registered intermediary — but it is worth having to hand before you start, because the application asks for all of it.

REGISTRATION

- SEBI registration number and a copy of the certificate
- ARN, if you also distribute mutual funds

THE ENTITY

- Legal name and entity type (company, LLP, partnership, proprietorship)
- Business PAN and GSTIN
- Registered city and state

PEOPLE

- A named contact person, email and mobile — this becomes your admin login
- An authorised signatory for the partner agreement
- A compliance contact to sign off which data surfaces are enabled

FOR A WHITE-LABEL

- Your logo and primary brand colour
- The subdomain you want to use, and access to its DNS

FOR AN API INTEGRATION

- A technical contact
- The server addresses your calls will come from

How it runs

1. **Scoping call**
   Which model, which data surfaces, and what your compliance function needs to see before signing off.
2. **Apply**
   A short online form capturing the entity, registration and documents listed opposite. Minutes, not days.
3. **Review and approval**
   We check the details and come back to you, usually within a couple of working days. Approval emails you a one-time link to set your password.
4. **Configure**
   We provision your tenant, apply your branding, set your data flags and lock the configuration you agreed. Your domain is pointed at us and certified.
5. **Go live**
   Take the white-label as it stands, or collect an API key and test against the real print engine from the documentation page before a single client sees it.

Ready when you are.

Applying costs nothing and commits you to nothing. We will tell you honestly whether the fit works — and if it does not, we will say so.
